

Beep beep beep..

Smoke alarms can sense smoke and beep loudly to warn you that there is a fire.

A smoke alarm will sense smoke often long before a person or animal does.

Smoke can kill.

You should have a smoke alarm on every floor of your home.

The best places to put smoke alarms are in the hallway and on the landing.

Smoke alarms should not be put in the kitchen, they would be often set off by the cooking and then people start to ignore the alarm.

Most smoke alarms work with batteries. If the batteries do not work then the smoke alarm will not work.

Smoke alarms should be tested once a week.

Never take the batteries out of the smoke alarm to use in something else like a toy.

The batteries should be changed once a year (unless it is a special smoke alarm with batteries which last 10 years).

Check everyone in your family and friends has working smoke alarms in their home.
